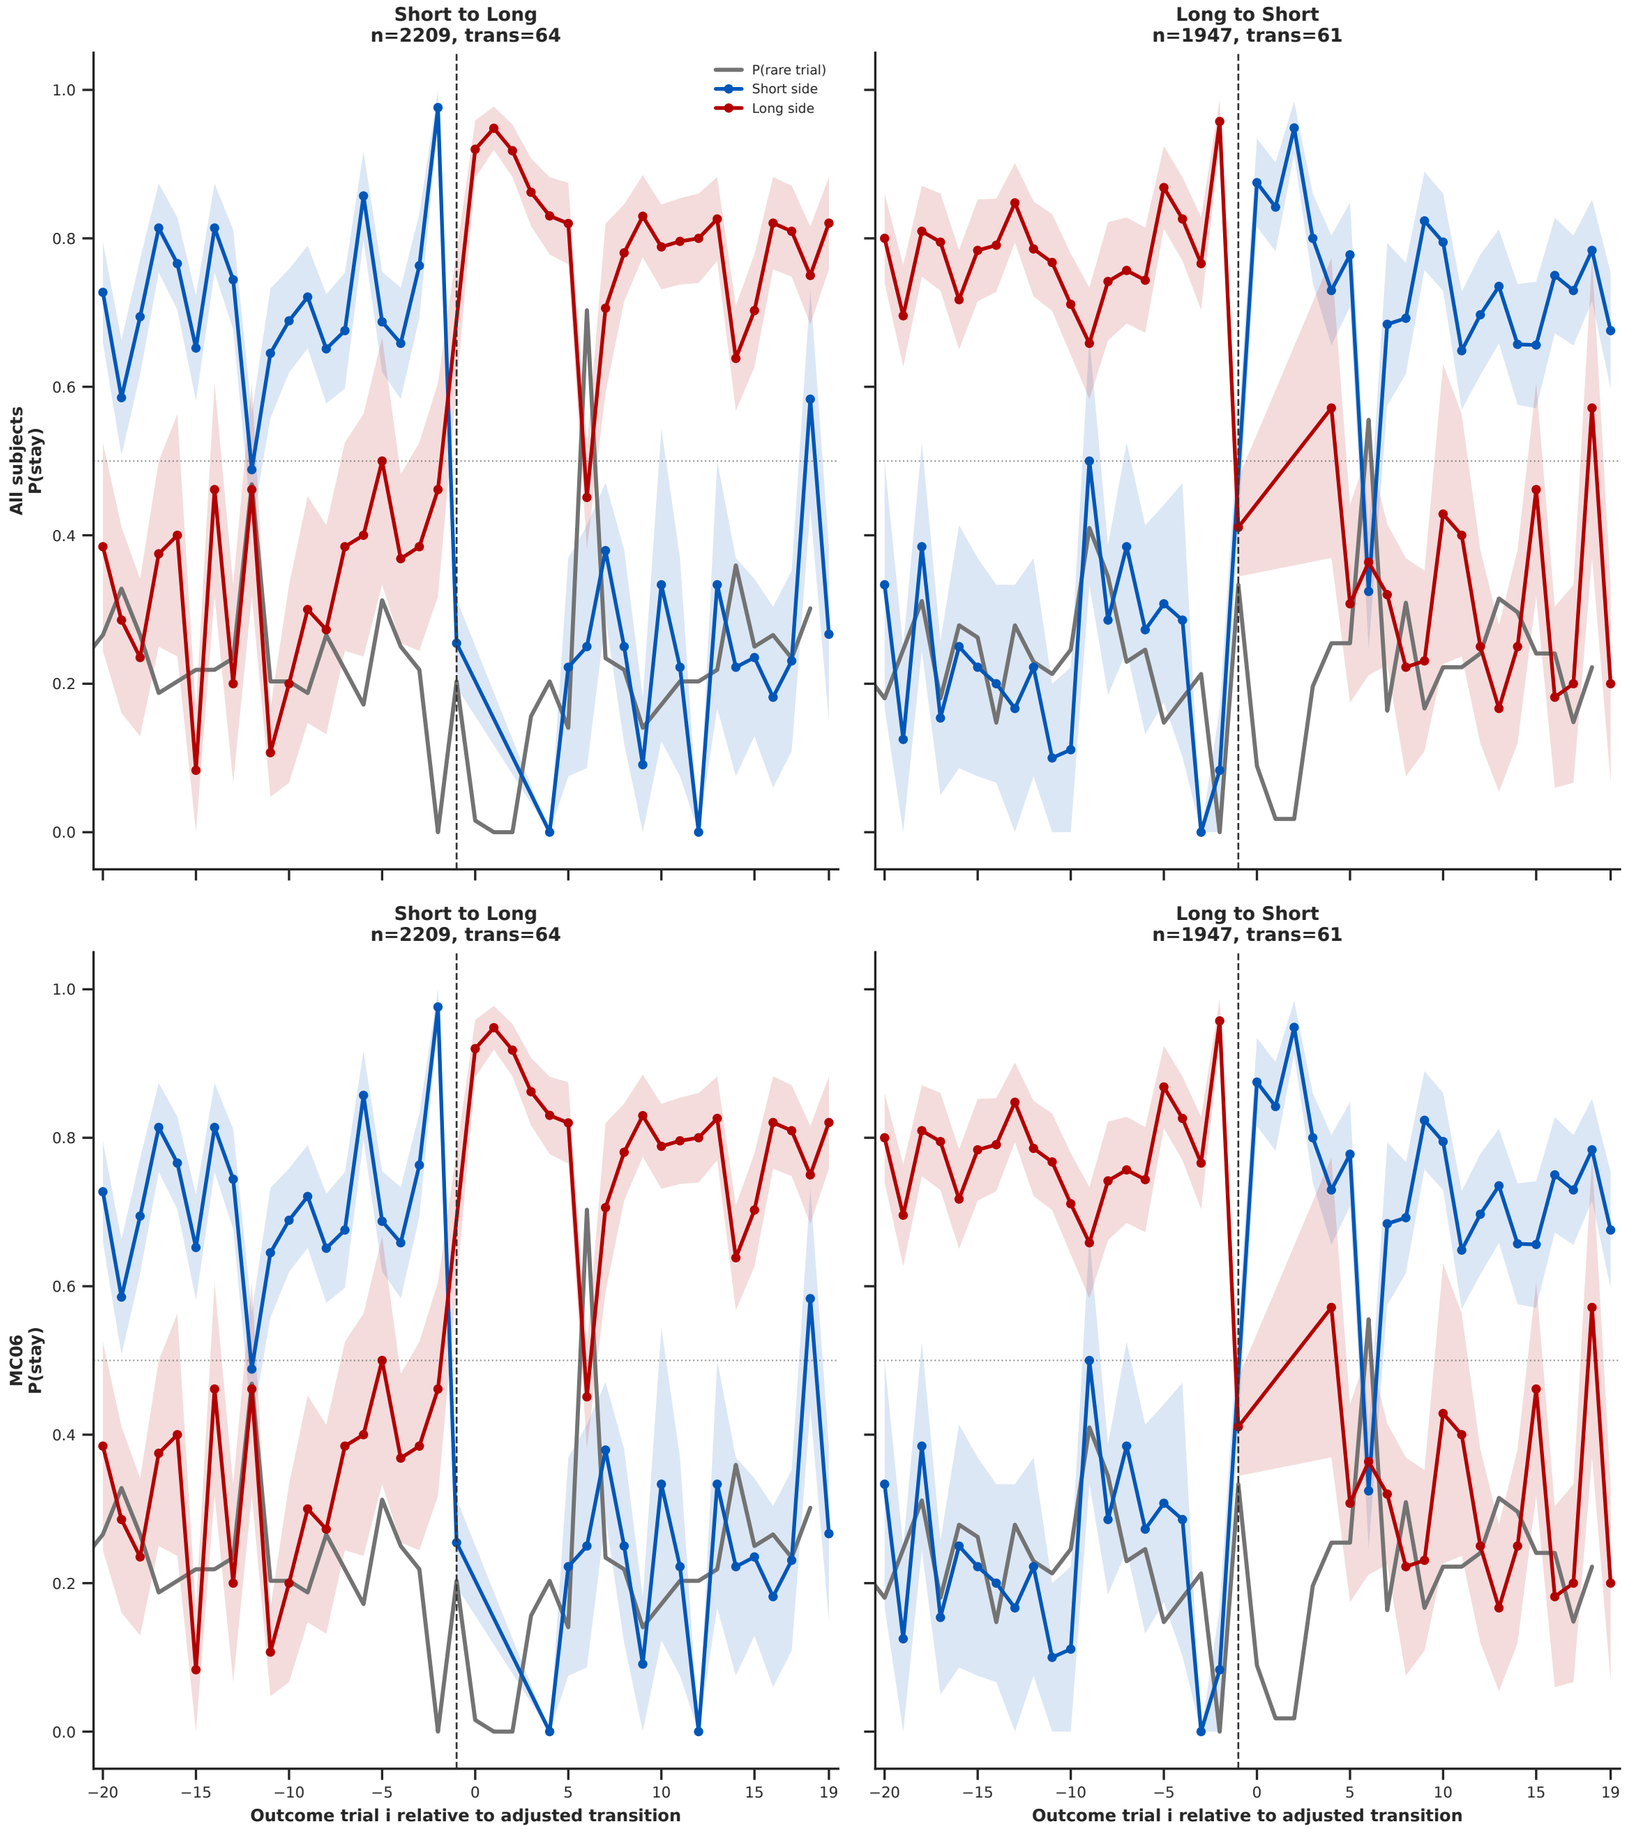
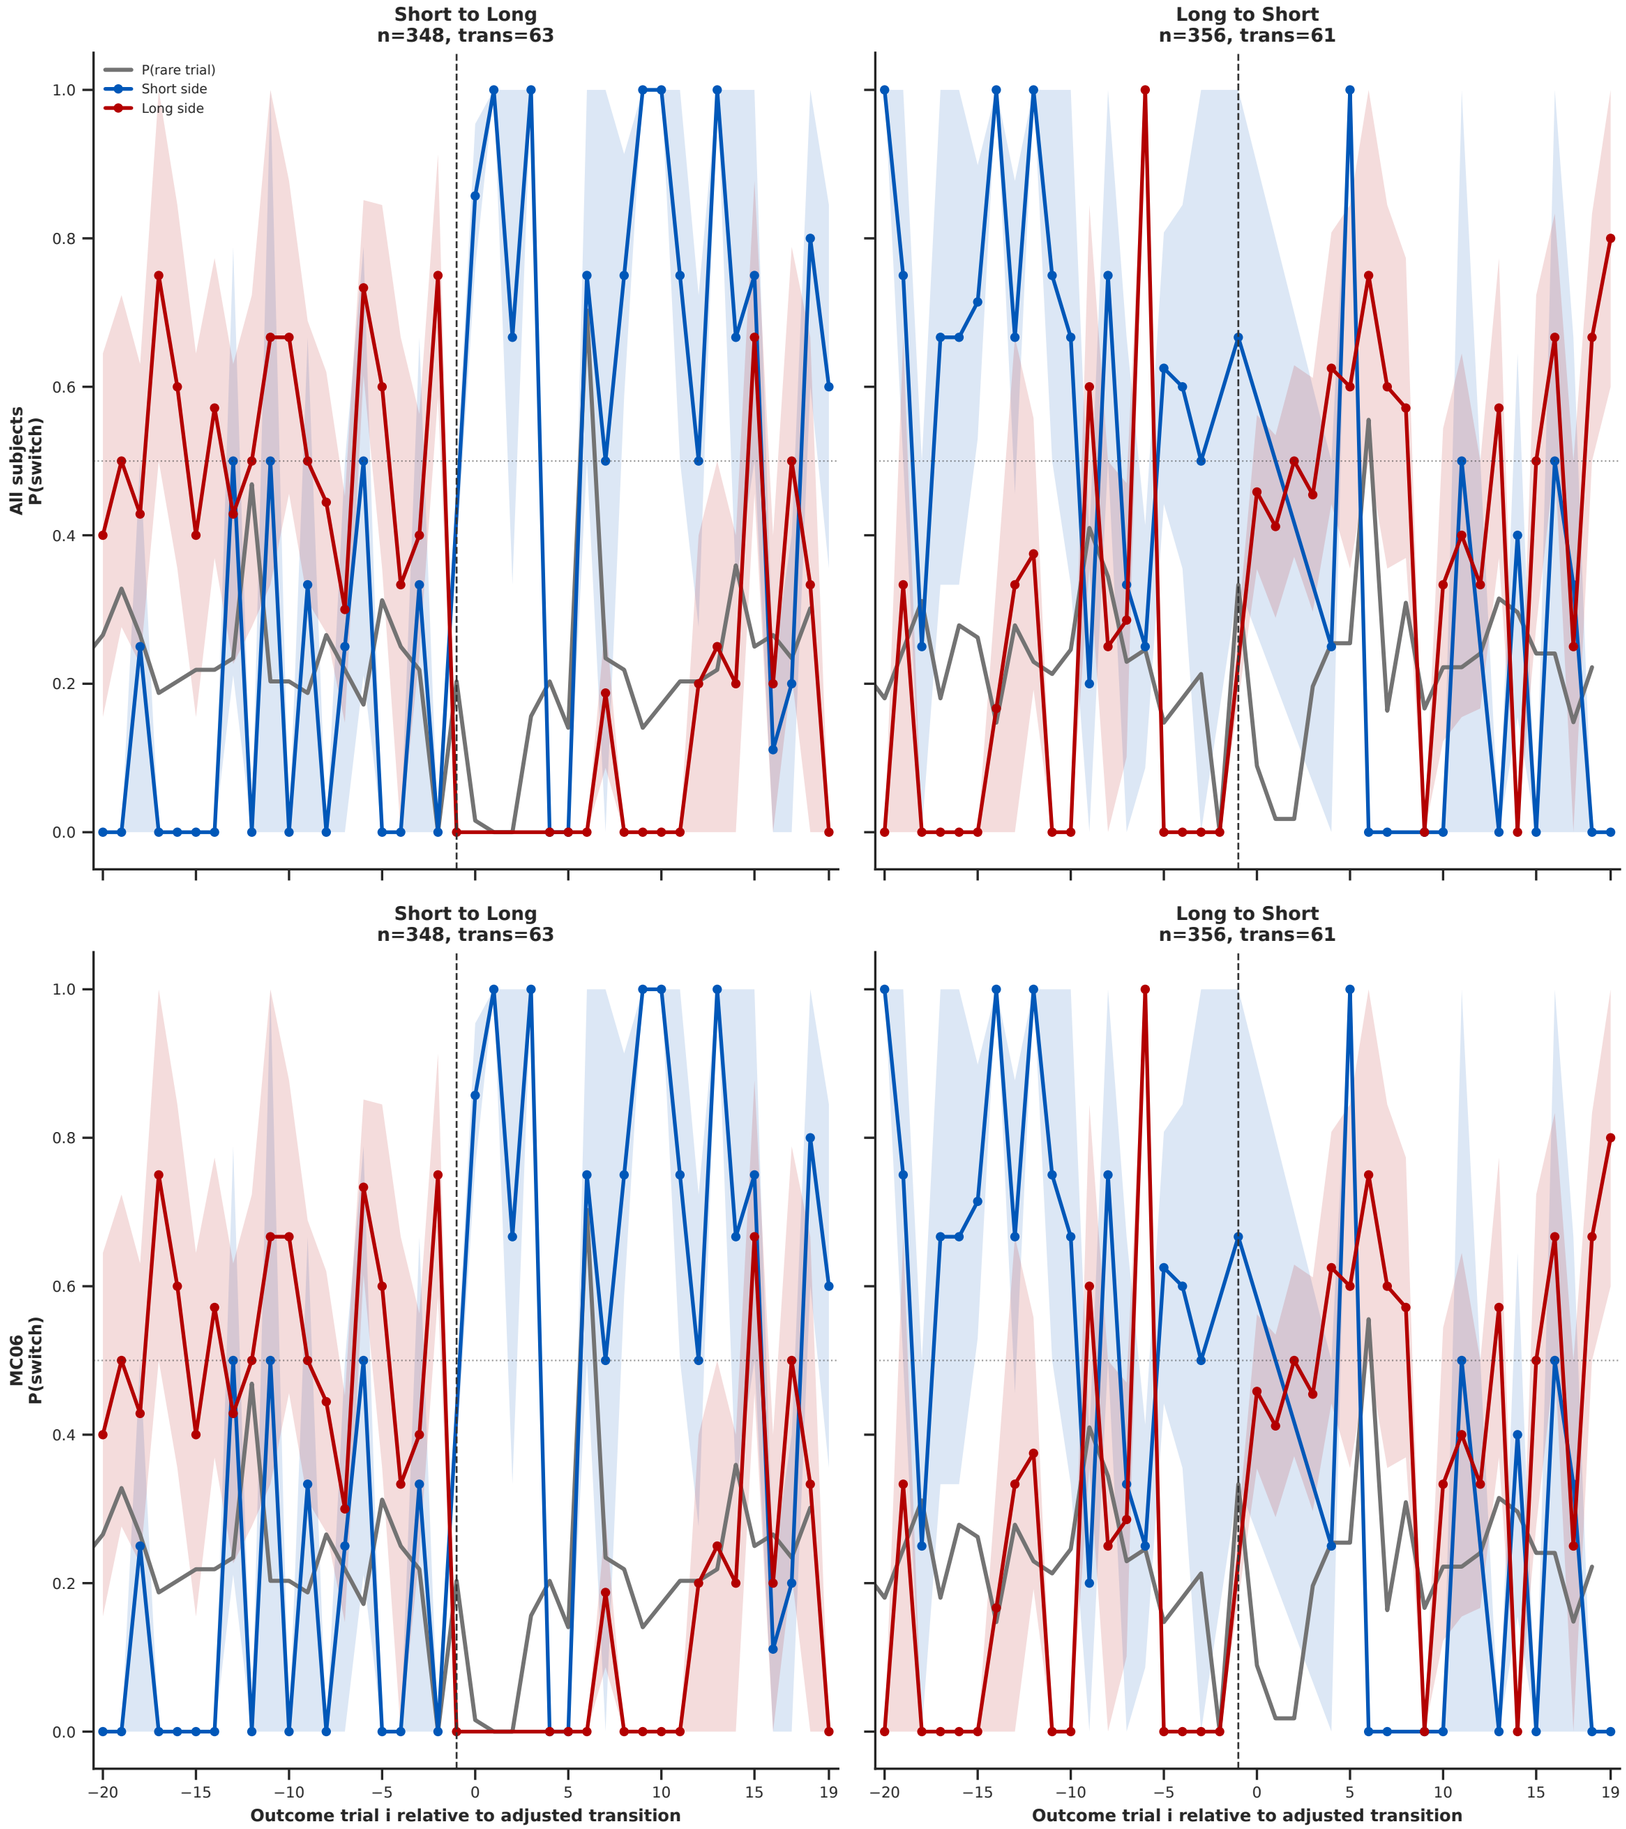
**P(stay | rewarded side) aligned to adjusted block transitions**
**Window: 20 trials before through 19 trials after alignment; rel_trial=0 follows the terminal-rare adjustment used above.**
**Anchor is outcome trial i; stay/switch is measured on i+1. Short/long sides pool contingency-corrected physical choices; gray = P(rare trial); windows stop before the following transition.**





**P(switch | punished side) aligned to adjusted block transitions**
**Window: 20 trials before through 19 trials after alignment; rel_trial=0 follows the terminal-rare adjustment used above.**
**Anchor is outcome trial i; stay/switch is measured on i+1. Short/long sides pool contingency-corrected physical choices; gray = P(rare trial); windows stop before the following transition.**
